NOTICE

When Government drawings, specifications, or other data are used for any purpose other than in connection with a definitely Government-related procurement, the United States Government incurs no responsibility or any obligation whatsoever. The fact that the government may have formulated or in any way supplied the said drawings, specifications, or other data, is not to be regarded by implication, or otherwise in any manner construed, as licensing to the holder, or any other person or corporation; or as conveying any rights or permission to manufacture, use or sell any patented invention that may in any way be related thereto.

This report is releasable to the National Technical Information Service (NTIS). At NTIS, it will be available to the general public, including foreign nations.

This technical report has been reviewed and is approved for publication.

This report provides design and technical documentation on the Turbine Blade Data Acquisition System developed by the Electronic and Computer Development Laboratory, within the University of Dayton Research Institute. It was designed and fabricated as an analytical tool for structural testing and research on turbine components as part of the Noncontacting Stress Measurement System. This research effort was performed for the Aerospace Mechanics Group of the Research Institute. Michael Drake was the Principal Investigator and Robert Dominic was the Research Engineer in charge of daily activities for this project.

E&CD Lab personnel who contributed to this research and development effort were:

Lab Supervisor G. Thomas Collins
Electronic Design J. Michael Aulds
Robert Blanchard
Fabrication and Checkout Ben Connally
Fred L. Davis
Steve Fuchs
Documentation Michael Gutman
Steve Fuchs
Report Assembly Sam Pietrantonio

NSMS Data Acquisition System - Tape Format

Fixed length - 512 byte records

block 0

```
bytes 0.. 3 : nb = number of blades
bytes 4.. 7 : nr = number of revolutions
bytes 8.. 11 : ns = number of stations
bytes 12.. 15 : average speed
bytes 16.. 19 : minimum speed
bytes 20.. 23 : maximum speed
bytes 24..127 : unused
bytes 128..136 : run date (DD-MMM-YY)
bytes 137..141 : excitation frequency
bytes 142..149 : run time (HH:MM:SS)
bytes 150..165 : radius
bytes 166..245 : run description
bytes 246..261 : run id
bytes 262..421 : specimen description
bytes 422..437 : specimen id
bytes 438..511 : unused
```

```
nbrd = number blocks for rev data = int((nr + 127)/128)
nbbd = number blocks for blade data = int((nr*nb+127)/128)
```

block 1..nbrd

```
bytes 0..3 : rev 1 time for station 1
bytes 4..7 : rev 2 time for station 1
.
```

block nbrd+1..nbrd+nbbd

```
bytes      0..3      : rev 1 blade 1 time for station 1
bytes      4..7      : rev 1 blade 2 time for station 1
.
.
bytes nb*4-4..nb*4-1 : rev 1 blade nb time for station 1
bytes nb*4..nb*4+1 : rev 2 blade 1 time for station 1 .
.
```

repeat from block 1 for station 2, 3 and 4
